Fan Support Installation

If you are retrofitting the fan support, or had removed it and now want to install it again, you will first need to remove the dome skylight in the same manner it was installed, but the reverse order (see Set Up Manual).

Notice that the ends of the fan support have pilot holes, which should face upward. The fan support will mount to the top side of the center ring. Slip the fan support into position (see diagram below) and secure it to the center ring with the four screws provided.

Your fan's mounting bracket will attach to the underside of the fan support. The power cord should go through the center hole in the fan support and can be attached along the top of one of your rafters. Follow the fan manufacturer's installation instructions and any applicable electrical codes for safe installation.
